Dredge Pump

Dredge pump is used for dredging operation for pumping materials such as mud, sludge, sand and other debris. It is sometimes called sand suction pump or sludge pump. Dredge pump uses the centrifugal force to move sediment out of river or other body of water. Our dredge pump is heavy duty and reliable. Our cast iron used metal alloy to increase resistance against abrasion. Common uses of dredge pump include: dredge mining or mining sand from river, lake or river dredging, maintenance dredging and more.
